

Relentless Resources Announces Heathdale Glauconite Oil Well Test

CALGARY, ALBERTA--(Marketwired - Oct 20, 2014) - Relentless Resources Ltd. ("**Relentless**" or the "**Company**") (**TSX VENTURE:RRL**) is pleased to announce initial test results from the Relentless Heathdale 8-7-27-9 W4 horizontal Glauconite oil well (the "**Well**").

The 100% working interest (before payout) farm-in Well was drilled over 8 days to a total measured depth of 2334 mKB and completed with a multistage, water-based, fracture completion. The Well was then equipped to pump and tied in with all solution gas being conserved.

The well test commenced on October 17, 2014 and has produced 767 barrels of fluid (396 barrels of sweet 26 API oil and 371 barrels of load water) within the first 48 hours. The gas rate is approximately 260 mcf/day.

A total of 5000 barrels of load water was used in the completion of the Well, of which less than 25% is expected to be ultimately recovered.

Relentless intends to continue to test the Well until such time as the majority of the expected load water is recovered. It will then be shut in for 7-10 days for a pressure build-up.

The Company advises that although the preliminary test rates from the Well are encouraging, test results are not necessarily indicative of long-term performance or of ultimate recovery from the Well.

Relentless has 8 sections of mineral land with Glauconite oil potential in the Heathdale Area under farm-in or as lessee.
